A scatter plot with red and green data points. The plot shows several gray, irregular decision boundaries that separate the red and green points. The red points are mostly in the upper-left and lower-right areas, while green points are mostly in the upper-right and lower-left areas.

Why data scientists like *Models*

Domains and definitions

Applied Data Science
INFO I-590
Spring 2018

Jeremy Yang
Associate Instructor

What kind of models?

- Scientific Models
- Statistical Models
- Predictive Models
- ... and more.

Fashion models?

Twiggy and
Kate Moss

Barbie and Ken dolls: Models of fashion models?

~ 1955

~ 2018

What is a model?

- Substitute
- Representation
- Proxy
- Simulation
- Pretender
- Virtual thing
- Idealized thing
- Simplified thing

What is a model?

- Concept
- Framework
- System of belief
- Understanding
- Mental construct
- Mental model

What kind of models?

Physical models

Patient model for medical training

Watson and Crick with their DNA model, ~ 1955

Computational models

Riboflavin, a.k.a.
vitamin B2,
molecular graph
data structure, via
3D graphics.

Animal models

Medical research
utilizes "animal
models" as
substitutes for
humans.

What kind of models?

A "statistical model" may refer to the assumed population distribution of a particular measure. More generally the statistical model may include the mathematical system involved in hypothesis testing, confidence interval generation, etc.

Predictive models

Usually statistics or machine learning based, predicting numerical or categorical outputs, for examples, from input features.

Models: In summary

Models of all sorts serve to connect **reality** with **thought**, to assist in cognition.
